Care continues after discharge

**Anita is home.
Maya has the document.
A result is still pending.**

Fictional family.
A real coordination problem.

41%

**had results return
after discharge**

2005 study of 2,644 discharges
at two academic hospitals.
A historical finding, not a current
global prevalence estimate.

A plan with the source still attached

Inspect the original words.

 Review the whole note, including what AI missed.
12 source segments have no linked follow-up. Keep every original instruction in view.

ⓘ

Details worth checking

Timing is not specified.

The source does not name a responsible care team.

These flags describe the original text. Your corrections below stay in the history.

Measured on known synthetic fixtures

33/34

**proposals matched
97.1% precision**

33/44

**expected actions found
75% recall**

Historical evaluation on 20 known synthetic documents.

Reused during fixes. Not held-out or clinical validation.

The next evaluation needs independently annotated documents.

A narrow first customer

**A primary-care or transitions coordinator
already chasing discharge follow-up.**

\$149

per month / 100 care episodes
Single-coordinator pricing hypothesis

The value to measure

Preparation time and correction burden.
Five minutes saved x 100 episodes
at \$35/hour = about \$292/month.

Illustrative inputs, before review and implementation costs. No observed ROI.

Built to inspect. The next proof is a pilot.

A complete browser workflow

Browser: model, rules, and transitions.
Firebase: hosting, sign-in, and storage.
57 live Firebase checks passed.
Owner isolation and persistence verified.

What the pilot must measure

Missed actions and corrections.
Preparation time and review burden.
Reported follow-up resolution.

Prototype tested with synthetic data. No clinical validation or proven health benefit.
