Care continues after discharge

**Anita is home.
Maya has the document.
A result is still pending.**

Fictional family.
A real coordination problem.

41%

**had results return
after discharge**

2005 study of 2,644 discharges
at two academic hospitals.
A historical finding, not a current
global prevalence estimate.

A plan with the source still attached

The screenshot displays the Looplight app interface for a care space named "Anita Rao". The top navigation bar includes the Looplight logo, a "Care space" dropdown, and a "FICTIONAL DEMO" label. The main content area is titled "THE NEXT CHAPTER OF CARE" and features a section "Every follow-up. Followed through." with a sub-header "A clear place for the things that still need to happen." and a "+ Add discharge notes" button. Below this is a timeline showing three steps: "Discharged" (Sep 13, 2026), "Follow through" (Open loops to close), and "Record completion" (0 user-reported). A "View the original notes" link is present. The "Your follow-ups" section shows three tasks: "Check the blood culture result" (SOURCE 88), "Follow up with your primary care clinician within 7 days of discharge." (SOURCE 88), and "Repeat a complete blood count in 2 weeks." (SOURCE 118). Each task has a "Needs your review" status. A bottom section shows a "CONNECTED TO THE SOURCE" status and a "Read source" link.

CONNECTED TO THE SOURCE

"Blood culture results are pending at discharge."

Read source

Anita's discharge summary · Fictional · Original instructions retained

Each task keeps its source

Open the supporting sentence and review the original wording.

A person tracks the next step

Confirm the details before following through.

Actual app. Fictional data.

A result can arrive before anyone reviews it

01 RESULT RECEIVED

The family has the result.

02 CLINICIAN REVIEW REPORTED

A user records who reviewed it.

03 OUTCOME RECORDED

The ledger retains the reported ending.

These states record user reports. They do not verify clinical outcomes.

Small model, visible limits

82%

**raw five-category
accuracy**

0.816

macro F1

44/50

**abstained at the
configured threshold**

225 synthetic training examples. 50 separately authored challenge examples.

Synthetic classification evidence. Clinical validation remains outstanding.

A narrow first customer

**A primary-care or transitions coordinator
already chasing discharge follow-up.**

\$149

per month / 100 care episodes
Single-coordinator pricing hypothesis

The value to measure

Preparation time and correction burden.
Five minutes saved × 100 episodes
at \$35/hour = about \$292/month.

Illustrative inputs, before review and implementation costs. No observed ROI.

The next proof is a supervised pilot

Can staff prepare a reliable plan faster?

Measure missed actions, corrections, and preparation time.
Then track follow-up resolution under supervision.

MVP for synthetic demonstration.

No clinical validation, EHR integration, or proven health benefit.
